# Georgetown Divide Public Utility District

**Domestic Water** 

**Irrigation Service** 

**On-Site Waste Disposal** 

1946~ 2014 Reflecting on the Past. Planning for the Future.

The Georgetown Divide Public Utility District is pleased to present this information to our customers, which includes two documents mandated by the California Department of Public Health, the **Annual Water Quality Report** /**Consumer Confidence Report** and **a State Notification Letter** regarding the District's water treatment processes.

#### DEAR WATER USER,

This report provides a snapshot of your water quality. We are pleased to report that in 2014 as in years past, your water met all U.S. Environmental Protection Agency (EPA) and state drinking water health standards. The District vigilantly safeguards its water supplies and once again, our water system has not violated a maximum contaminant level or any other water quality standard. Included in these pages are details on where your water comes from, what it contains and how it compares to state standards. For additional information on water quality, customers may contact GDPUD at (530) 333-4356.

### **About Contaminants**

If present, elevated levels of lead can cause serious health problems especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. GDPUD is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

# Some People Are More Vulnerable

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA and Centers for Disease Control (CDC) guidelines on appropriate means to lessen risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791) or find it on EPA's website www.water.epa.gov/drink/index.cfm.

# **Natural Materials Can Enter Water**

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, reservoirs and canals. As water travels over the surface of the land it dissolves naturally occurring minerals and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial Processes and petroleum production, and can also come from gas stations, urban stormwater runoff, septic systems and agricultural application.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. *(Continued on back page)*

# Georgetown Divide Public Utility District PUBLIC NOTICE TO DISTRICT CUSTOMERS OLDER WATER TREATMENT PROCESS DOES NOT MEET NEW STATE STANDARDS

# Dear Customer,

The Georgetown Divide Public Utility District takes great pride in the high quality of the water we supply to our customers. In our many years of service, our water has always met or exceeded state and federal public health standards. Even though our water continues to meet all of these standards, one of the methods in our water treatment process has become outdated under today's state standards. This is not surprising in a smaller, rural community where water treatment plants are older (the Auburn Lake Trails plant was built in 1971). It is financially challenging for a district with a small customer base to pay for millions of dollars in water system improvements. Ten years ago, on February 9, 2004, the California Department of Public Health, Office of Drinking Water issued an administrative order (No. 01-09-04CO-002) that instructs the district to comply with state regulations regarding the filtration of drinking water. Printed here is the state's public notification message:

# NOTIFICATION OF FAILURE TO COMPLY WITH DRINKING WATER TREATMENT STANDARDS

"The Georgetown Divide Public Utility District is providing this notice at the direction of the State of California Department of Public Health, Division of Drinking Water and Environmental Management (Department) to bring to your attention certain matters regarding the treatment of your drinking water supply. The Department establishes standards for the quality of drinking water, including regulations for the quality of water supplies drawn from lakes and streams (i.e., surface water). If such water is inadequately treated, microbiological contaminants in the water may cause disease. Disease-causing organisms, if present, can cause symptoms including diarrhea, cramps, nausea, and possibly jaundice, and any associated headaches and fatigue. (These symptoms, however, are not just associated with disease-causing organisms in drinking water, but also may be caused by a number of factors other than your drinking water.) Since it is infeasible to analyze treated water for all disease-causing organisms that may be present, the Department has established enforceable requirements (Surface Water Treatment Regulations) for treating surface water to reduce the risk of these adverse health effects. The regulations include specific criteria for filtering and disinfecting surface water to remove or destroy microbiological contaminants. Drinking water that is treated to meet these criteria is considered to be safe. The Georgetown Divide Public Utility District water treatment plants use a filtration technology that is not among those listed in the Surface Water Treatment Regulations. Because the District has not demonstrated to the Department that its treatment plants provide a degree of treatment equivalent to the listed technologies, the plants are not considered to be in compliance with the Department's regulations. The District is currently working toward bringing the ALT water treatment plant into compliance with the regulations or constructing new facilities that will comply with the regulations. It is estimated that all improvements to the system will be made in 2016. The District will keep you informed on a regular basis of progress made to resolve this issue. If you have any questions regarding this notification, or our service, please call GDPUD at (530) 333-4356".

#### **District Summary**

The Walton Lake water treatment plant was upgraded in 2005 which brought the plant into compliance with State regulations. The Auburn Lake Trails (ALT) water treatment plant was considered to be state of the art when it was built, but the "in-line filtration" technology does not meet current standards. Your Board of Directors wants to provide the best possible service to customers but is also very concerned about costs and resulting impacts on water rates. The district is making significant progress with the ALT water treatment plant project. The new Auburn Lake Trails Water Treatment Plant, which will meet state and federal surface water treatment standards when complete, is on track to be completed in 2016. In the meantime, you may consider your water safe to drink.

# GEORGETOWN DIVIDE PUBLIC UTILITY DISTRICT

PO BOX 4240, GEORGETOWN, CA 95634-4240

OFFICE HOURS: M-F 7:45 AM-4:30 PM

#### Your GDPUD Board Members

The Board meets regularly on the second Tuesday of each month, at 2:00 p.m. at the District offices, located at 6425 Main Street in Georgetown. Your Board members are:

Norm Krizl. President

- Norm Krizi, President
  Carl Hoelscher, Vice President
- Carl Hoelscher, Vice Preside.
  Maria Capraun, Treasurer
- Jesse Hanschild, Director
- Lon Uso. Director

#### Continued from page 1) WATERSHED HEALTH Water Source Assessment

Source water protection is the primary barrier for providing safe drinking water. A contaminant that does not enter the water source does not need to be removed. An assessment of the district's drinking water source was completed in December 2002. The source is considered most vulnerable to the following activities for which no associated contaminants have been detected in the water supply: historic gas stations, historic mining operations, wastewater treatment systems. forest management activities. recreational use, storm drain and storm water discharges and illegal dumping. You may request a copy of the complete assessment or a summary at the GDPUD office or by contacting Bruce Berger, the CDPH Sanitary Engineer, at (916) 449-5666.

#### Water Quality Rules Explained

In order to ensure that tap water is safe to drink, the EPA and CA Department of Public Health (CDPH) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that must provide the same protection for public health. California notification levels are available on the Department's website www.cdph.ca.gov/certlic/drinkingwater/Pages/Notification Levels.aspx

#### **Your Water Supply**

Your water originates in the Sierra, flows into Stumpy Meadows Reservoir and is transported through a Gold Rush-era canal system and pipes to the Walton Lake and Auburn Lake Trails water treatment plants. The Walton Lake plant serves the communities of Georgetown, Garden Valley, Kelsey and Greenwood. The Auburn Lake Trails plant serves Auburn Lake Trails, Cool and Pilot Hill. Both plants use a multi-barrier process to ensure the quality of your drinking water. Each plant uses liquid bleach to disinfect raw water before it undergoes treatment. The treatment process involves coagulation for the removal of fine particles, filtration using sand and anthracite, disinfection, and reduction of corrosivity through use of sodium carbonate. Treated water is stored in tanks and piped to customers.
